inputLine
 cat in lo

currWord

~~cat in lo.??~~

inputLine
 cat is cute lol ...

currWord

bigWord

5/1

5//

~~double power (double value, double factor);~~

~~0.0~~

// board should not be NULL

~~int fcn (Board * board)~~

~~board cannot be NULL~~

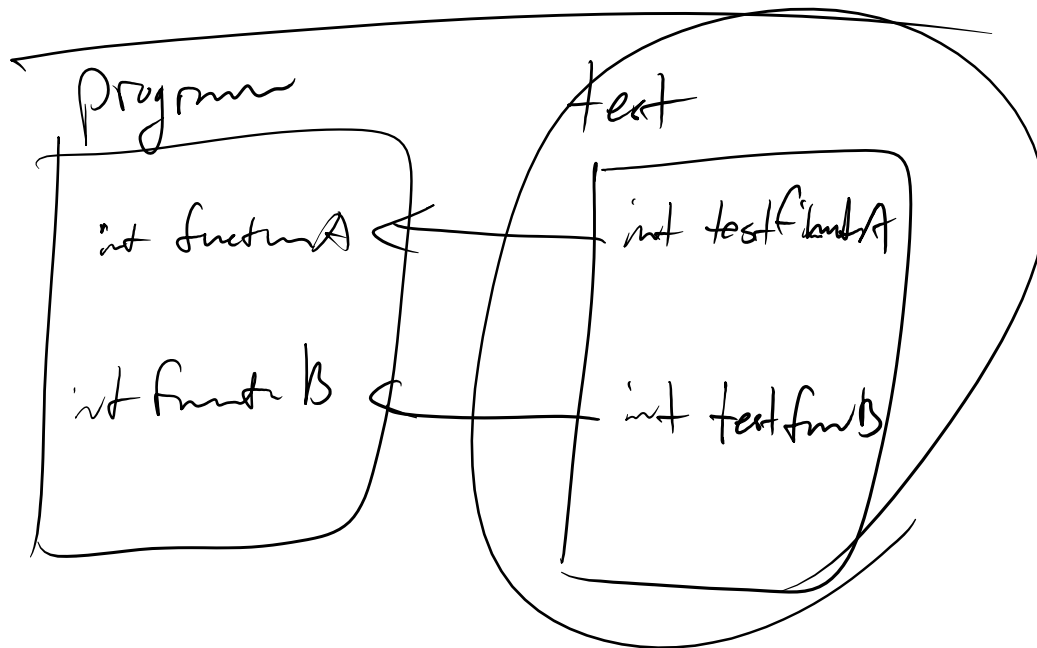

char * strdup (...)

int fcn (Board * ptr) {

assert (ptr != NULL);

if (ptr != NULL) ?

}

`int funcA`

==
==
==

`if()`

`assert(--)`
`return`

- function performs correctly
at any given time

- to make sure it's working fine,
make a test using scaffolding

make a test using scaffolding

- assert / if

check your pre- / post- conditions
are right,

→ Design by Contract

- if you write code,

and then write test,

you may miss something

```
int checkSorted (int* array, int size)
```

```
{ if (size > 1) return 1;  
  return 0;  
}
```

```
void testCheckSorted () {
```

```
int data[] = { 1, 0 };
```

```
assert (!checkSorted(NULL, 0));
```

```
assert (!checkSorted(data, 0));
```

```
assert (checkSorted(data, 1));
```

```
assert (checkSorted(data, 2));
```

Test Driven Development

- write test first
- make your function pass
all tests.

```
//  
_____  
//  
_____
```

```
printf(" . . . " );
```

`flush(stdout);` ✓
